(Asphalt-based)

Rolled Asphalt Pavement

This is a pavement where single-sized aggregate is dispersed and pressed-fitted in a dense mixture. A mixture type is also available.

Overview

- This is a pavement made with a gap-grading mixture where a certain amount of a mainly single-sized coarse aggregate is mixed into an asphalt mortar.
- It has excellent stability and good slip prevention because a pre-coated macadam is dispersed/pressure-fitted immediately after the mixture for the wearing course is spread.

Features

- Excellent slip prevention, fatigue crack resistance, watertightness, and wear resistance.

Applications

- Road pavement for cold and snowy regions
- Road pavement for mountainous areas
- Bridge surface pavement
