Urban Deck Sand

Overview

- Urban Deck Sand is a thin-layer colored pavement made of colored sand as the main aggregate mixed with flexible epoxy resin.
- It has high responsiveness to the base material and can be applied to places where deflection occurs, such as on steel plate decks.

Features

- With its excellent flexibility, it suppresses cracks and debonding which are characteristic of thin-layer resin pavement. Also compatible with bridge surface pavements such as pedestrian bridges.
- From a wide variety of colors, you can choose a color that matches with the surrounding landscaping.
- Different particle size aggregates are blended to create a surface finish with a fine texture that is highly durable and safe.

Applications

- Pedestrian Bridges
- Pedestrian Decks
- Sidewalks
- Park Roads and Plazas
- Cycling Roads
